

Signature Umbrella's incorporate the following features that make them very dependable in any weather condition they would be expected to be used in.

The capstan (hub) is the key component in the construction of the umbrella frame, its function is to secure the ribs to the top of the pole, and at the mid point. Strength is critical when the umbrella is erected as the capstan carries most of the weight of the frame while holding the ribs in place. For superior strength the signature capstan is turned from one solid section of Kwila hardwood with stainless steel hardware securing the ribs. One piece center pole turned from straight grained Kwila hardwood.

The Signature has extra large venting that allows wind and discomforting heat trapped on the under side to easily escape through the generously scalloped opening. This keeps you cool in the shade while ensuring stability in breezy conditions.

Covers are custom made in the colour of your choice they are trimmed and secured using marine edge binding together with nickel plated gromets and brass hardware. Leather used to reinforce stress points.

Optional intergrated lighting system to enhance the setting.
